standard*

Porcelain

Urine Diverting

Ecologic

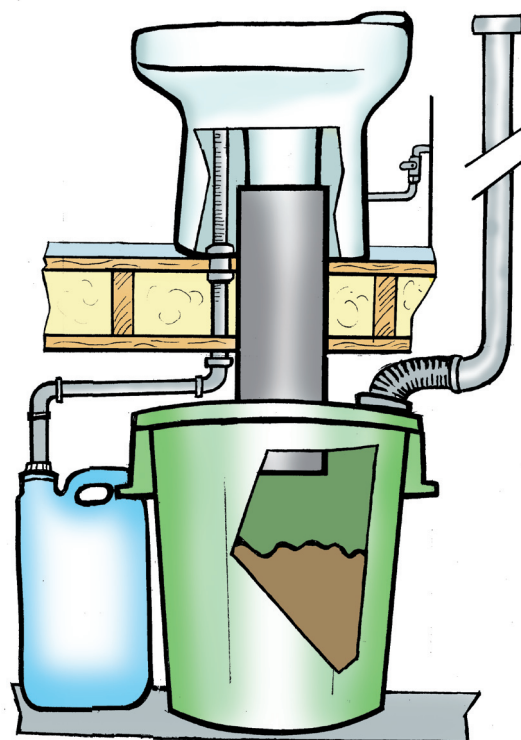

Ecologic

ECO-DRY[®] is the most ecologic kind of toilet on the market, with every part developed to make it as convenient, ecological, and hygienic as possible. The porcelain is necessary to achieve optimal hygien, and is also the most sustainable material. For the user it feels similar to a water toilet.

Urine Diverting

The urine bowl has a water flush for those who have access to water. When you push the button it flushes about 0,1-0,2 litre water, and together with the urine it leads to a can or tank of your own choice. If there is no access to water, you can flush manually with a cup of water. No chemicals are needed. It is also possible to attach a big can of water to the toilet, to use as flush water.

How it works

The urine separates from the feces which makes it possible to achieve odour free waste, and to be able to use the urine as fertilizer. The feces falls down to a barrel of your choice, where it evaporates and dehydrates. If you use a fan (recommended) the feces becomes completely dry and all bacteria and virus will be killed. A barrel of 80 litre, usually lasts 3 months (normal family). When emptying the barrel it only weighs 10-20 kilo.
